

ABSTRACT OF THE DISCLOSURE

5 A material dispenser system for allowing convenient unloading, loading and
6 dispensing of a spool of elongate material. The material dispenser system includes a
7 plurality of prongs formed for rotatably receiving a spool of material, a main body
8 receiving the prongs, and a handle attached to the main body. The prongs are
9 comprised of a resilient material for allowing the distal portions thereof to be forcibly
10 contracted thereby allowing the spool of material to be unloaded and a replacement
11 spool to be loaded. The prongs each have a flanged portion that extends outwardly
12 thereby retaining the spool positioned upon the prongs.
